ABSTRACT. Two species of the subfamily Moelleriinae Hickman et McLean, 1990 – *Moelleria costulata* (Møller, 1842) and *Spiromoelleria quadrae* (Dall, 1897) – have been reported from the northwestern Pacific so far. The present paper clarifies their distribution in the region based on the museum collections and newly obtained material from the northwestern Pacific. Also, one more species, *Spiromoelleria maculata* (Golikov et Gulbin, 1978), which previously had been considered as a member of the genus *Homalopoma* Carpenter, 1864 (subfamily Coloniinae), is here suggested to be a member of Moelleriinae.

Introduction

Only three species had been known in the subfamily Moelleriinae Hickman et McLean, 1990 – *Moelleria costulata* (Møller, 1842), *Spiromoelleria quadrae* (Dall, 1897) and *Spiromoelleria kachemakensis* Baxter et McLean, 1984. Two of them have been reported from the northwestern Pacific so far – *Moelleria costulata* and *Spiromoelleria quadrae* [Golikov, Gulbin, 1978; Kantor, Sysoev, 2006; Sirenko et al., 2013].

All these species have a calcareous operculum and rhipidoglossate radula, as do the members of the genus *Homalopoma* Carpenter, 1864 (prior to the present work, the latter genus was placed in the subfamily Colloniinae Cossmann, 1916 [Schroeder, 2012]). But *Moelleria* Jeffreys, 1865 and *Spiro-*

moelleria Baxter et McLean, 1984 differ from *Homalopoma* in its having an operculum with a multispiral pattern on its exterior surface, and having the operculum unable to retract deeper than flush with the apertural margin [Baxter, McLean, 1984] (compare Figs 1 A, E and Figs 2 A-B). In accordance with this, the species, which was earlier described as *Homalopoma maculata* Golikov et Gulbin, 1978 (Figs 2 C-D), should be removed from the genus *Homalopoma*, because its operculum has a multispiral pattern of the inner side, and it is unable to retract beyond the aperture.

The spiral sculpture of *Homalopoma maculata* is characteristic for *Spiromoelleria*, and *Homalopoma maculata* does not have the typical feature of the genus *Moelleria* – the coalescing axial sculpture (compare Figs 1 A, B and Figs 2 C-D). So in this paper we place *Homalopoma maculata* in the genus *Spiromoelleria*. Additionally, based on the new findings in the Sea of Japan, Okhotsk, Bering and Chukchi seas we clarify the distribution of the species of the subfamily Moelleriinae in the NW Pacific.

Materials and methods

The material described in the article is housed in the collections of the Zoological Institution of the Russian Academy of Sciences, Saint-Petersburg (ZISP) and was collected off eastern Kamchatka in

2013 and 2014 by R/V "MRTK-316", in the Chukchi Sea in 2004 and 2012 by R/V "Professor Khromov", in the Sea of Okhotsk in 2013 and 2014 by R/V "TINRO", "Professor Probatov" and "Professor Kizevetter" and in the Barents Sea in 2008, 2009, 2012 by R/V "Dalnie Zelentsy" and "Viking-2".

The shells were studied using MSP-2 stereomicroscope with DCM-130 digital camera. Scanning electronic microphotographs of the radulae were taken with a FEI SEM Quanta 250. Radulae were cleaned from tissues with a water solution of sodium hypochlorite and then were washed with distilled water.

Taxonomic description

Class Gastropoda

Subclass Vertebrata

Superfamily Phasianelloidea Swainson, 1840

Family Colloniidae Cossmann, 1916

Subfamily Moelleriinae

Hickman et McLean, 1990

Genus *Moelleria* Jeffreys, 1865

Type species: *Margarita costulata* Møller, 1842 (by monotypy).

Moelleria costulata (Møller, 1842)

(Figs 1 A-C, Fig. 3 (squares))

Margarita costulata Møller, 1842: 83; Schiøtte, Warén, 1992: 8, figs 27-29.

Moelleria costulata. – Abbott, 1974: 61, fig. 501; Baxter, McLean, 1984: 221, figs 2, 4 (bibliography); Hickman, McLean, 1990: figs 15A, 16B; Kantor, Sysoev, 2006: 39, pl. 18 B; Sirenko et al., 2013: 152.

Type material: Syntypes: ZMUC GAS-24, GAS-25, GAS-26.

Type locality: West Greenland: "Baals River",

Julianeab [Schiøtte, Warén, 1992].

Material studied: The Sea of Okhotsk, ZISP 54252/60, near Sakhalin Island, 49°01.0'N, 144°41.5'E, 75 m, R/V "Toporok", st. 82, 02.12.1947, 2 alive. KB PGI, 57°39.4'N, 155°57.6'E, 100 m, R/V "Professor Probatov", st. 63, 15.08.2013, 3 alive. Southeast Kamchatka, KB PGI, 52°11.5'N, 158°49.6'E, 258 m, R/V "MRTK-316", 06.06.2014, st. 25, 1 alive. KB PGI, Kamchatka Bay, 55°10.0'N, 162°2.1'E, 200 m, R/V "MRTK-316", 07.06.2013, st. 5, 2 alive. KB PGI, Kamchatka Bay, 55°30.0'N, 162°0.5'E, 250 m, R/V "MRTK-316", 05.06.2013, st. 11, 1 alive. The Bering Sea, ZIN 46303/53, Korfa Bay, 16 m, R/V "Raduga", SCUBA, 27.07.1975, 1 alive. The Chukchi Sea, ZIN 60807/62, 70°45.58'N, 175°32.0'W, 71.8 m, R/V "Professor Khromov", st. 106, 18.08.2004, 1 alive. ZIN 60808/63, 71°23.73'N, 174°54.7'W, 69.7 m, R/V "Professor Khromov", st. 62B, 21.08.2004, 1 alive. ZIN 61938/64, 68°20.804'N, 167°10.089'W, 30 m, R/V "Professor Chromov", st. CS-17, 01.09.2012, 1 dead. The Barents Sea, LMBI, Murman Coast, Dolgaya Inlet, 69°10.23'N, 34°57.39'E, 13 m, R/V "Dalnie Zelentsy", st. 5S-2, 29.05.09, 19 alive (radula of 1 spec. studied with SEM); LMBI, Murman coast, Yarnyshnaya Inlet, 69°07.64'N, 36°02.01'E, 73 m, M/S "Viking-2", st. 5-2, 19.09.12, 1 alive (radula studied with SEM); LMBI, Svalbard, Hopen, 76°11.042'N, 23°11.776'E, 49 m, R/V "Dalnie Zelentsy", st. 20-2, 21.08.08, 24 alive (radula of 2 spec. studied with SEM).

Remarks. We observed the same variability in the shell sculpture of this species as MacGinitie [1959], who reported shell variation for individuals collected off Point Barrow, Alaska, the Chukchi Sea. Baxter and McLean [1984] wrote that the number of spiral cords on shell base varies from 0 to 9.

Distribution. Circumpolar in the Arctic Ocean. In the Atlantic distributed south to Maine, Greenland, Iceland, and Morocco. Alaskan distribution from Attu, Aleutian Islands, to Turner Bay, Taku Inlet, southeastern Alaska [Baxter, McLean, 1984]. The species was found in the northern-west Bering Sea (Korfa Bay) for the first time.

Genus *Spiromoelleria*
Baxter et McLean, 1984

Type species: *Moelleria quadrae* Dall, 1897 (by original designation).

7, 8 (bibliography); Hickman, McLean, 1990: figs 15B, 16A; Kantor, Sysoev, 2006:39, pl. 18A; Sirenko *et al.*, 2013: 152.

Moelleria drusiana Dall, 1919: 358 (fide Baxter, McLean, 1984).

Type material: Syntypes: USNM 107441 and Canadian Geological Survey Museum.

Type locality: western Canada, Cumshewa Inlet, Queen Charlotte Islands.

Material studied: Kurile Islands, ZIN 27600/1, Simushir Island, Krasnovatai rocks, 20 m, sealer "Krilatka", st. 247, sample 608, 07.09.1970, 1 alive. H=1.5 mm. Alaska, ZIN 58632/1, Kachemak Bay, 59°20.0'N, 151°36.0'W, 0-46 m, 1957-1979, 74 alive, from Los Angeles County Museum.

Remarks. Baxter and McLean [1984] wrote that "spiral sculpture of variable number (49-77 of fine, narrow cords; spiral cords present throughout, from suture to umbilical walls, stronger on base, with wider interspaces on base". The examined 74 specimens from Kachemak Bay showed more variability in high of shell (Fig. 1D) and especially in spiral sculpture of shells. One part of the specimens have spiral cords only in base of their shells, other part of specimens have spiral cords throughout, and one specimen has no spiral cords. These specimens probably were extracted from different samples, collected in different places. Unfortunately we do not know exactly the depth where the specimens were collected, depth range was recorded as 0-46 m.

Distribution. *Spiromoelleria quadrae* was collected near Middle Kurile Islands, Simushir Island, near Aleutian Islands, Attu and Amchitka Islands, near Kodiak Island, in Kachemak Bay, Prince William Sound, and Cumshewa Inlet, British Columbia [Baxter, McLean, 1984; Sirenko *et al.*, 2013].

Spiromoelleria maculata
(Golikov et Gulbin, 1978) comb. nov.
(Figs 2 C-F, Fig. 3 (circles))

Homalopoma maculata Golikov, Gulbin, 1978: 181, fig. 7; Kantor, Sysoev, 2006:42, pl. 18 G-G'; Gulbin, Chaban, 2012: 13; Sirenko *et al.*, 2013: 152.

Type material: Holotype ZISP 27608/1.

Type locality: Pacific ocean, middle Kurile Islands, Ekarma Island, 1.5 nautical mile to the west of Cape Krugliy, 20 m, sealer "Krilatka", st. 341, sample 898, 16.10.1971.

Material studied: The holotype. **The Sea of Okhotsk**,

Description. We are giving a translation from Russian of the original description [Golikov, Gulbin, 1978] with additional comment on the operculum:

"Shell small, low conical, with three quickly growing, prominent, rounded whorls, divided with distinct depressed suture. Spire low, crowded. Last whorl most prominent, evenly rounded and occupy 18/19 of shell height. Color of shell not uniform: spots and strips (often vertical) from light brown to dark brown on dirty-grey ground. Axial sculpture consists of irregularly placed deep growth lines. Spiral sculpture consists of distinct, slightly flattened ribs, interspaces as wide as the ribs. Ribs arranged more compactly on the shell base. There are about 20 ribs on the last whorl. Aperture round-

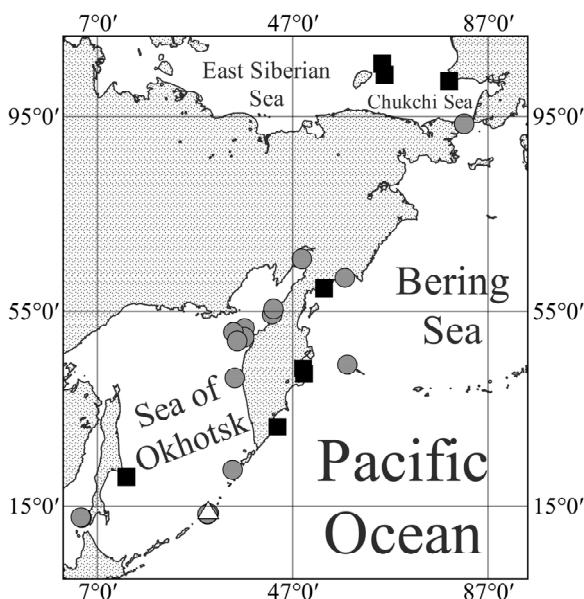

FIG. 3. Distribution of the species of the subfamily Moelleriinae in the northwestern Pacific: Squares—*Moelleria costulata*; Circles—*Spiromoelleria maculata*; Triangle—*Spiromoelleria quadrae*.

РИС. 3. Распространение представителей подсемейства Moelleriinae в северо-западной части Тихого океана: квадраты—*Moelleria costulata*; круги—*Spiromoelleria maculata*; треугольник—*Spiromoelleria quadrae*.

ed, with closed peristome. Inner and outer lips of aperture thin, evenly rounded, imperceptibly transfer to each other. Umbilicus semicircular, wide, but not deep. Height of shell of holotype 2.0 mm, height of aperture 1.45 mm, width of aperture 1.4 mm. Largest specimen, collected near Simushir Island in Broutona Bight at depth 15 m, on sandy and stony bottom with shell, having 2.5 mm in height, diameter of last whorl 3.1 mm, height of last whorl 2.25 mm, height of aperture 1.75 mm, width of aperture 1.65 mm.

Rachidian tooth of radula wide, almost square. Five lateral teeth; length of their blades increases from the middle of radula to edges. About 20 marginal teeth."

Comparison of radulae of three species (Fig. 1C, F, 2F) shows some similarities and differences. Radulae of *Moelleria costulata* (Fig. 1C) and *Spiromoelleria quadrae* (Fig. 1F) have rachidian teeth with narrowed appendix in center of the top, whereas rachidian teeth of *Spiromoelleria maculata* (Fig. 2F) have no appendix. Lateral teeth of *Moelleria costulata* and *Spiromoelleria quadrae* have sharp distal part, whereas *Spiromoelleria maculata* has lateral teeth without distal part like *Homalopoma luridum* (Dall, 1885) [Hickman, McLean, 1990, Fig. 20A]. Fide Hickman and McLean [1984] the main difference of radulae of Coloniinae from Moel-

leriinae is the presence of secondary flap on the rachidian tooth. Operculum not retractable, tightly fit to aperture margin, interior surface of operculum flat, multispiral exterior surface slightly concave.

Remarks. Careful examination of the type material of *Homalopoma maculata* revealed a mistake in the generic position of the species. It has a multispiral operculum, which is typical character for the subfamily Moelleriinae, but not of the subfamily Colloniinae which includes genus *Homalopoma*. Taking into consideration the multispiral operculum and spiral sculpture of *H. maculata*, we suggest it to be a member of *Spiromoelleria*.

Spiromoelleria costulata is very similar to Alaskan *S. kachemakensis* Baxter et McLean, 1984, but differs from it by having 20 spiral ribs on the last whorl (vs. 35–50 ribs in *S. kachemakensis*). Probably *S. kachemakensis* is endemic to the Gulf of Alaska, because Baxter and McLean [1984] reported that this species is absent near Kodiak Island and to the west.

Distribution. Previously *Spiromoelleria maculata* was collected in the Sea of Japan (near Monevron Island), near Middle Kurile Islands (Simushir, Ekarma, Makanrushi and Rasshua Islands), and near Commander Island [Golikov, Gulbin, 1978: 181–182; Kantor, Sysoev, 2006: 42; Gulbin, Chaban, 2012: 13; Sirenko *et al.*, 2013: 152]. The species is mentioned for the first time from the Sea of Okhotsk and the Bering Sea (Olutorskiy Bay and the Bering Strait).

Acknowledgements

We would like to thank Alexey Miroljubov (ZIN) who helped us with SEM images, Julia Sigwart (Queen's University Marine Laboratory Portaferry, Northern Ireland) for linguistic corrections of the manuscript.

РЕЗЮМЕ. В северо-западной Пацифике ранее были известны только два представителя подсемейства Moelleriinae Hickman et McLean, 1990 – *Moelleria costulata* (Møller, 1842) и *Spiromoelleria quadrae* (Dall, 1897). В данной работе на основании изучения коллекционного материала и новых сборов произведено уточнение ареала этих видов, и в состав подсемейства Moelleriinae включен еще один вид – *Spiromoelleria maculata* (Golikov et Gulbin, 1978), который ранее считался представителем рода *Homaloroma* Carpenter (подсемейство Coloniinae), 1864.
